The H. influenzae sequence has been updated by R. Fleischmann. New
database matches have been assigned, product names have been
improved, and a number of frame shifts have been corrected. We
gratefully acknowledge the work of Tatusov et. al. We have
incorporated their annotation into the /notes fields of the
corresponding H. influenzae genes

Direct Submission

N. Submitted (28-MAY-1998) The Institute for Genomic Research, 9712

Medical Center Dr. Rockville, MD 20850, USA

The whole genome was shifted by 588 nucleotides for a new start

On oct 1, 1996 this sequence version replaced gi:1222062.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Escherichia coli. This sequence may be used to impart L-threonine resistance on E. coli bacteria, which would be useful for producing a high yield of L-threonine. L-threonine resistance means that the bacteria will be able to grow on a minimal medium containing L-threonine at a concentration at which the corresponding wild-type strain would not grow. Since the transformed bacteria can grow on the minimal medium, it can synthesise L-threonine, which accumulates The accumulated amino acids can then be removed from the culture medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               bacterium of the present invention may also be used to synthesise pmoserine, L-valine and L-leucine at increased levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the L-threonine resistance gene, rhtC, from

```
The present sequence is the yahN gene (an excretion protein gene) of Escherichia coli. The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the cell. In this case, an increase in lysine, glutamic acid and proline is achieved if multiple copies of the gene are transfected into a bacterium. The bacterium used is E. coli.
                                                                                                                                                                                                                                                                                                                                                          of L-amino acids by an Escherichia bacterium the expression amount of an L-amino acid excretion

The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the cell. In this case, an increase in lysine, alamine, valine, histidine, isolaucine, glutamic acid and proline is achieved if multiple copies of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Increased production of L-amino acids by an Escherichia bacterium comprises increasing the expression amount of an L-amino acid excretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Troshin PV;

Sequences A61501-A61524 represent nucleotide sequences encoding
Agrobacterium vitis hypersensitivity response (HR) elicitor proteins
(B1630-B1688). The HR is a rapid, localised necrosis that is
(B1630-B1688). The HR is a rapid, localised necrosis that is
cubically second to be a rapid and element of the pathogenic organism interacts with a nonhost plant (i.e., one in which intracellular bacterial growth and disease development do not occur). Like other HR elicitors, the A. vitis elicitor functions in non-host plants by causing a rapid hypersensitive response that results in alling-off and killing of the pathogen. On grape plants, the A. vitis HR elicitor induces a restricted necrosis of tissues, resulting in the death of plant cells and induction of pathogen resistence. A. vitis HR elicitor proteins, in non-infectious form, are used to treat plants or their seeds to impart resistence to disease, such as those caused by fundy, bacteria or viruses; and to enhance growth, e.g., to increase yield or to provide earlier germination or maturation. The proteins can also be used to cold, and to impart resistence to environmental stresses, e.g., cold, and to impart nesistence to environmental stresses, e.g., cold, and to impart nesistence to environmental stresses, e.g., cold, and to impart per encodes A. vitis HR elicitor proteins. Use of A. vitis HR elicitor proteins, or nucleic acids encoding them, may allow control of previously untreatable diseases; provide systemic treatment; and encodes and encodes provide systemic treatment; and encodes and eliminate the need for biological control agents or polluting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New protein from Agrobacterium vitis, useful e.g. for imparting resistance to disease or stress to plants, is involved in production of a hypersensitive response

    A. vitis hypersensitive response elicitor-encoding DNA, SEQ ID NO:6.

```
Novel RhtB protein, useful for generation of L-homoserine resistance in Escherichia bacteria and large-scale production of e.g. L-homoserine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the DNA sequence the novel rhtB gene of Escherichia coli Kr-12. The rhtB gene maps at 86 min on the B. coli chromosome. The gene participates in resistance to homoserine. Amplification of the gene results in an improvement of the amino acid productivity of E. coli. The invention provides: the RhtB protein (see Y1928B): DNA encoding the RhtB, especially nucleotides 557-1171 of the present sequence; a bacterium, especially of the genus Escherichia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= a //*tag= a //note= "a DNA sequence corresponding to the coding region (minus the stop codon) is specifically claimed in Claim 3"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1539

copy number or increasing the expression rate of the rhtB DNA, the DNA being carried on a multicopy vector or on a transposon; and a method for producing an amino acid by cultivating the bacterium in a culture medium to produce and accumulate the amino acid in the medium, from which it is recovered. The method is used for the production of L-homoserine, L-alanine, L-isoleucine, L-valine or L-threonine (all claimed).

```
The present sequence is the L-homoserine resistance gene, rhtB, from Escherichia coli. This sequence may be used to impart L-homoserine resistance on E. coll bacteria, which would be useful for producing a high yield of L-homoserine. L-homoserine resistance means that the bacteria will be able to grow on a minimal medium containing L-homoserine at a concentration at which the corresponding wild-type strain would not grow. Since the transformed bacteria can grow on the minimal medium, it can synthesise L-homoserine, which accumulates. The accumulated amino acids can then be removed from the culture medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel Escherichia bacterium having enhanced L-threonine resistance due to enhanced RhtC protein activity, used to produce L-threonine, L-homoserine, L-valine and L-leucine -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tokhmakova IL,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The bacterium of the present invention may also be used to synthesise L-threonine, L-valine and L-leucine at increased levels.

Novel gene encoding marine mela from Shewanella - useful as selectable marker in genetic engineering and for inducing larval
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The 5' end of an open reading frame (T06767) was identified directly downstream of the Shewanella colvelliana melA gene (T06766), and was designated m19A (mel-linked gene). The role of the encoded protein (R87577) was unclear as deletion subcloning in E. coli demonstrated that only melA was required
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 228 TIGGIGAGCTAGCAGGCGTTGCCTCGTGGCGATTGCCGCCGTAATGGGT 277

The invention relates to MelA proteins from marine bacterium of the genus Shewanella, Vibrio or Hyphomonas. The MelA protein is active in catalysing production of melanin synthesis, as well as components of marine exopolysaccharides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        marine bacterium; melanin synthesis; marine exopolysaccharide;

                                                                                                                                                                                                                                       1121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This DNA, isolated from Corynebacterium glutamicum, contains the LysG, LysE and ORF3 genes. LysG and LysE encode a lysine transport regulatory protein and an export protein, respectively. Microbial production of amino acids (A) is improved by increasing the export-carrier activity and/or the export gene expression in a microorganism that produces (A). The method is specifically used to increase production of lysine, used as an animal feed addittive. Other (A) are variously useful as pharmaceuticals, condiments and intermediates for fine chemicals. This method increases the amount of (A) secreted into the culture medium. Export of (A) has been found to depend on a single gene.

NB. This sequence has been created from the information given in table 2
                                                                                                                                                                                                          LysG; LysE; ORF3; lysine transport; regulatory protein; export protein; Microbial production; amino acid; animal feed additive; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Increasing microbial production of amino acids, especially lysine by improving export carrier activity or corresponding gene expression, also new export and regulatory genes from

The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the case in an increase in arginine, glutamic acid and lysine is achieved if multiple copies of the gene are transfected into a bacterium. The bacterium used is E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Increased production of L-amino acids by an Escherichia bacterium comprises increasing the expression amount of an L-amino acid excretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Troshin PV;

                            The present sequence is the yflk gene (an excretion protein gene) of Escherichia coil. The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the cell. In this case, an increase in threonine, histidine, glutamic acid and proline is achieved if multiple copies of the gene are transfected into a bacterium. The bacterium used is E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             130 leTyrPheGlySerValPheSerLeuPheValGlyAspAsnValGlyThr 146

factors (NDF's). The perildes encoded by these CDNA clones isolated from human tissues and cell lines, possess the ability to stimulate human pl8-neu tyrosine phosphorylation. These peptides have the ability to induce a differentiated phenotype in certain cell lines and can stimulate or inhibit proliferation of certain cell lines. The NDF's can be used to treat wounds, tumours derived from epithelial tissue of the breast, stomach etc., gastrointestinal disease, Barrett's ossophagus, (non-)oystic kidney disease or inflammatory bowel disease. These cDNA sequences may be used in a recombinant plasmid for the recombinant production of the NDF's in a pro- or eukaryotic host cell.

represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiporvalatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; antiporvalant; antiparthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coaquiant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; antidiabetic; hypotensive; dermatological; immunosuppressive; antitinfammatory; antibacterial; antivizal; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, cardiovascular disease, disorders may expense and used to treat cancers, proliferative disorders, cardiovascular disease, disorders may expremant to the second processing the proteins in an antiparial and an action and cartilage damage, nocturnal heamoglobinuria, antiminammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                           Novel nucleic acids and peptides derived from open reading frame X, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              97 uAlaValSerAlaProAlaProGlnValGluLeuAlaLysSerGlyArgS 114

This invention decribes novel human nucleic acid sequences from tumor breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-length gene sequences. They can be used to express proteins, which can be used as tools to find an activity against breast cancer. The sequences can be used in sense or antisense form. They are especially useful for medicaments for gene therapy to treat breast cancer. 233611-248617 represents expressed sequence tags described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rosentahl A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human nucleic acid sequences and protein products from tumor breast
tissue, useful for breast cancer therapy -

Lybercleal protein BH2932 (imported) - Bacillus halodurans (strain C-125)

C;Species: Bacillus halodurans

C;Species: Bacillus halodurans

C;Species: Bacillus halodurans

C;Species: Bacillus halodurans

C;Species: Bacillus halodurans

C;Species: Bacillus halodurans

C;Accession: D84016

R;Takami, H; Nakasone, K; Takaki, Y; Maeno, G; Sasaki, R; Masui, N; Fuji, F; H

Nucles. Complete genome sequence of the alkaliphilic bacterium Bacillus halodurans a

R;Reference number: A83650; MUID:20263314

A;Accession: D84016

A;Status: preliminary

A;Molecule type: DNA

A;Residues: 1-210 <STC>
A;Cross-references: GB:AP001517; GB:BA000004; NID:g10175500; PIDN:BAB06651.1; GSPDB:G

C;Genetics:

A;Gene: BH2932

C;Superfamily: hypothetical protein b1798
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A)Title: Complete genome sequence of Pseudomonas aeruginosa PA01, an opportunistic pa A)Title: Complete genome sequence of Pseudomonas aeruginosa PA01, an opportunistic pa A)Teference number: A82950; MUID:20437337
